VARIEGATED CUTWORMS

A number appearing at the bottom of a colored box are moths trapped during the nights highlighted by color
Note: ***Bolded numbers*** *indicate substantial moth flight for a single or several night sequence*

Although Nebraska threshold levels not been developed based on moth catches, some states have thresholds suggesting that large and continual catches greater than 25 per week will result in similarly large populations of variegated cutworm caterpillars being observed approximately 2 weeks following peak trap counts.
