

# 2022 Nebraska Farm Custom Rates

Glennis A. McClure, Extension Educator – Farm & Ranch Management Analyst  
Jim A. Jansen, Agricultural Economist

A survey of agricultural custom operators is conducted in Nebraska every two years. A total of 193 survey responses were received in 2022 with information reflecting the current rates charged by custom operators for machine hire services and other work they provide for neighboring farms and ranches or as part of a business enterprise that covers a broader area. Survey participants identified by Nebraska Extension personnel, or in some cases, self-identified custom operators, received a paper survey or a web link to complete the custom rates survey online.

Actual rates paid for custom services may vary from those listed in these survey results due to differences in the operators responding and those providing services across the State. This report provides a summary of State averages for specific custom operations in Table 1. More detailed information covering results of the custom rates survey by Nebraska Agricultural Statistical Districts is provided in two parts. Part I of the survey focused on spring and summer farm and ranch operations

such as planting, tillage, and baling hay. Part II of the custom rates survey included questions about fall operations such as harvesting, hauling grain and livestock, as well as miscellaneous custom work activities on the farm.

Detailed custom rate information from survey responses included in Part I and II are grouped by Nebraska Agricultural Statistics Districts as shown on the map below (Figure 1). Due in part to the State’s diversity in agriculture, rates for similar operations can vary greatly from one area of the State to another. Custom rates reported include charges for use of necessary equipment, fuel, labor, and supplies such as baling wire or twine provided by the custom operator.

**Seed, fertilizer, and chemical costs are not included the custom rates unless specified per operation. The information presented in this publication should be used only as a guide when figuring what to charge or pay for custom operations.**

Figure 1. USDA Agricultural Statistics Services reporting districts for Nebraska.

The **Number Reporting** is the number of usable responses received for a specific operation. The results from operations with more responses are considered to be more reliable than those with fewer responses. Results are not reported if fewer than three usable responses were reported for an operation.

The **Average Rate** for a specific operation provides an estimate of the prevailing charge for an operation. The reliability for this figure improves as the number of responses increase for a particular operation. The size of the range should also be viewed when considering the average, as the range of answers in some cases may be wide.

The **Most Common Rate (Mode)** is the rate reported more often than any other for that practice. The Average Rate and the Mode are usually similar. The results do not include a mode figure when any value fails to be reported more than once or when two or more values are reported the same number of times.

The **Range** shows the minimum and maximum amounts reported. These values may be indicative of different conditions under which the work was performed. The range also may reflect the fact that some rates include travel to and from the field while others do not.

### **Costs to Consider in Establishing Custom Rates**

Be aware that average custom rates reported may not cover all of an operator's costs. Rates change from year to year due to expense changes and the availability of custom operators. The rates reported in the publication were the prevailing rates in the spring of 2022. In determining the rates beyond 2022, custom operators and farm owners should consider their cost of machinery, labor, and fuel.

The rates provided in this report do not necessarily measure the full economic cost of performing the work specified. Some custom operators may only charge for fuel and labor. Other operators may charge for all costs, including depreciation on equipment, personal property taxes, a charge for risk, and a return to management. Field conditions such as size of area, terrain, and location will vary, which could partially account for the range in the rates charged.

### **Calculating Cost Associated with Fuel Price Changes**

The following is an example showing how custom rates may be adjusted as fuel prices change. If the farm price for diesel increases \$0.75 from \$3.05 to \$3.80 per gallon and the consumption rate of the machine operation is 0.80 gallons per acre, the cost increase due to the higher fuel prices would be  $\$0.75 \times 0.80 = \$0.60$  per acre. This additional cost would be added to the custom rate quoted in the 2022 results.

### **Calculating Machine Costs to Utilize in Setting Custom Rates**

Variability in the rates reported across the statewide survey suggest that calculating machine costs based on ownership and operating expenses provide value when determining custom rates. Certain custom rates reported in Nebraska fully account for covering operating and ownership costs of machinery and equipment. If sufficient custom rates information does not exist in a specific district or if an operator has upgraded equipment, then calculating an updated custom rate may be necessary. Those that provide custom services on a commercial scale should account for machinery, labor, and other related expenses that appropriately produces returns at a larger scale over a long period of time.
